

# Chapter 2: Application layer

- ❑ 2.1 Principles of network applications
- ❑ 2.2 Web and HTTP
- ❑ 2.3 FTP
- ❑ 2.4 Electronic Mail
  - ❖ SMTP, POP3, IMAP
- ❑ 2.5 DNS
- ❑ 2.6 P2P applications
- ❑ 2.7 Socket programming with TCP
- ❑ 2.8 Socket programming with UDP
- ❑ 2.9 Building a Web server

# FTP: the file transfer protocol

- ❑ transfer file to/from remote host
- ❑ client/server model
  - ❖ *client*: side that initiates transfer (either to/from remote)
  - ❖ *server*: remote host
- ❑ ftp: RFC 959
- ❑ ftp server: port 21

# FTP: separate control, data connections

- ❑ FTP client contacts FTP server at port 21, TCP is transport protocol
- ❑ client authorized over control connection
- ❑ client browses remote directory by sending commands over control connection.
- ❑ when server receives file transfer command, server opens 2<sup>nd</sup> TCP connection (for file) to client
- ❑ after transferring one file, server closes data connection.

- ❑ server opens another TCP data connection to transfer another file.
- ❑ control connection: "out of band"
- ❑ FTP server maintains "state": current directory, earlier authentication

# FTP commands, responses

## Sample commands:

- ❑ sent as ASCII text over control channel
- ❑ USER *username*
- ❑ PASS *password*
- ❑ LIST return list of file in current directory
- ❑ RETR *filename* retrieves (gets) file
- ❑ STOR *filename* stores (puts) file onto remote host

## Sample return codes

- ❑ status code and phrase (as in HTTP)
- ❑ 331 Username OK, password required
- ❑ 125 data connection already open; transfer starting
- ❑ 425 Can't open data connection
- ❑ 452 Error writing file

# Chapter 2: Application layer

- ❑ 2.1 Principles of network applications
- ❑ 2.2 Web and HTTP
- ❑ 2.3 FTP
- ❑ 2.4 Electronic Mail
  - ❖ SMTP, POP3, IMAP
- ❑ 2.5 DNS
- ❑ 2.6 P2P applications
- ❑ 2.7 Socket programming with TCP
- ❑ 2.8 Socket programming with UDP

# Electronic Mail

- ❑ Most widely used application on the internet
- ❑ For sending mails (conjunction):
  - ❖ Simple Mail Transfer Protocol (SMTP)
  - ❖ Multi-purpose Internet Mail Extension (MIME)
- ❑ For receiving mails:
  - ❖ Post office protocol version 3 (POP 3) or
  - ❖ Internet mail access protocol (IMAP)

# Electronic Mail: SMTP [RFC 821]

- ❑ All details about SMTP in RFC 821
- ❑ Transmits simple text messages only - 7 bit ASCII file
- ❑ uses TCP to reliably transfer email message from client to server, port 25
- ❑ direct transfer: sending server to receiving server
- ❑ three phases of transfer
  - ❖ handshaking (greeting)
  - ❖ transfer of messages
  - ❖ closure
- ❑ command/response interaction
  - ❖ **commands:** ASCII text
  - ❖ **response:** status code and phrase

# SMTP

- ❑ Uses information written on envelope of mail to transfer mail
  - ❖ Message header
  - ❖ Contains recipient address and other information
- ❑ Does not look at contents or message body as long as it is in simple text
  - ❖ Only look at the message header

# Mail message format

SMTP: protocol for exchanging email msgs

RFC 822: standard for text message format:

- header lines, e.g.,

- ❖ To:
- ❖ From:
- ❖ Subject:

*different from SMTP commands!*

- body

- ❖ the "message", ASCII characters only

# Basic Operation

- ❑ Mail is created by user agent program (mail client)
- ❑ Messages are queued and sent as input to SMTP sender program
  - ❖ Typically a server process
  - ❖ Daemon on UNIX eg. sendmail or qmail

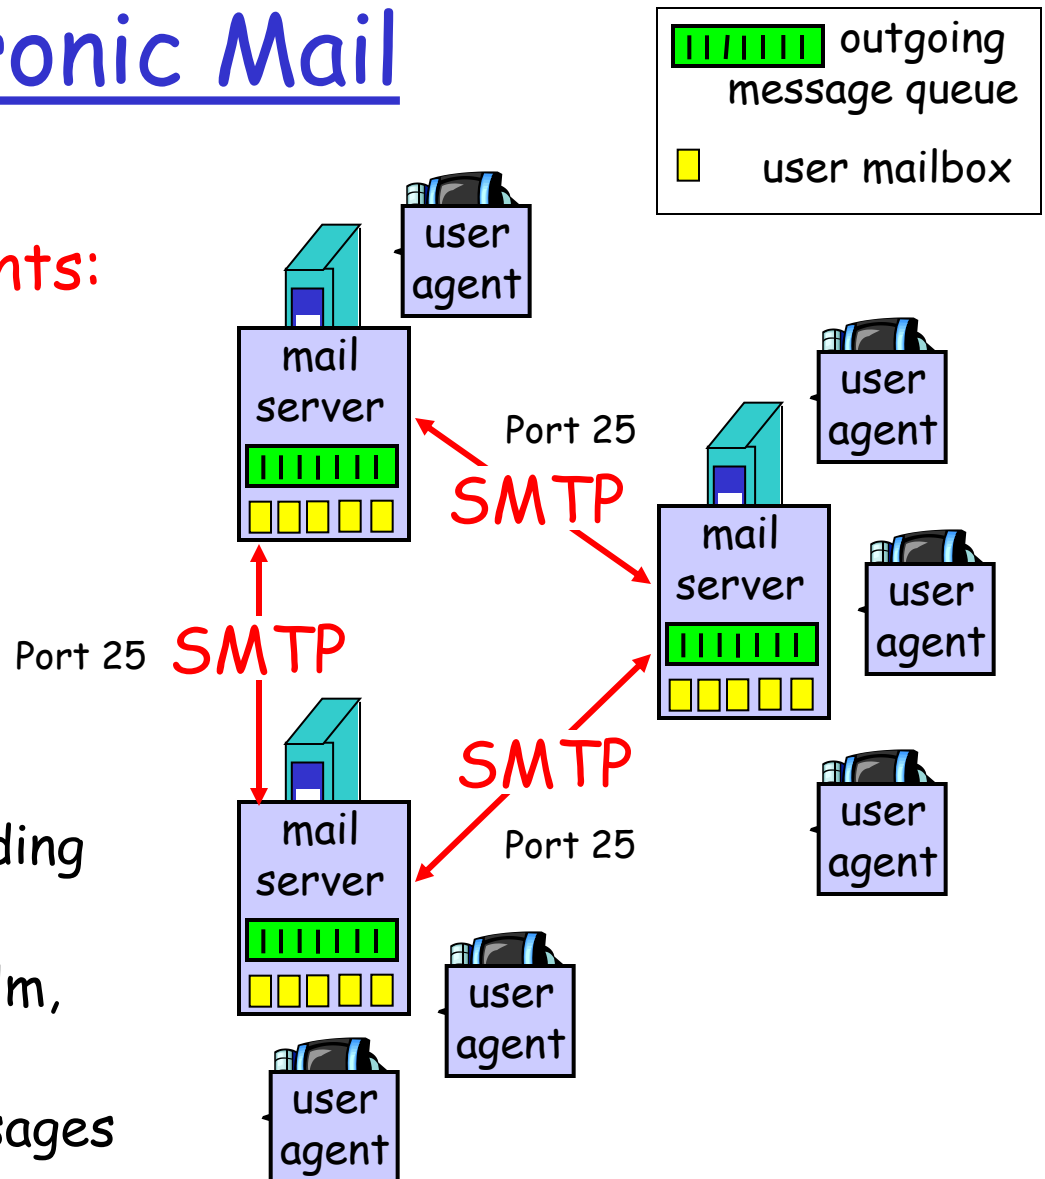

# Sending Electronic Mail

## Three major components:

- ❑ user agents
- ❑ mail servers
- ❑ simple mail transfer protocol: SMTP

## User Agent

- ❑ a.k.a. "mail reader"
- ❑ composing, editing, reading mail messages
- ❑ e.g., Eudora, Outlook, elm, Mozilla Thunderbird
- ❑ outgoing, incoming messages stored on server

# Electronic Mail: mail servers

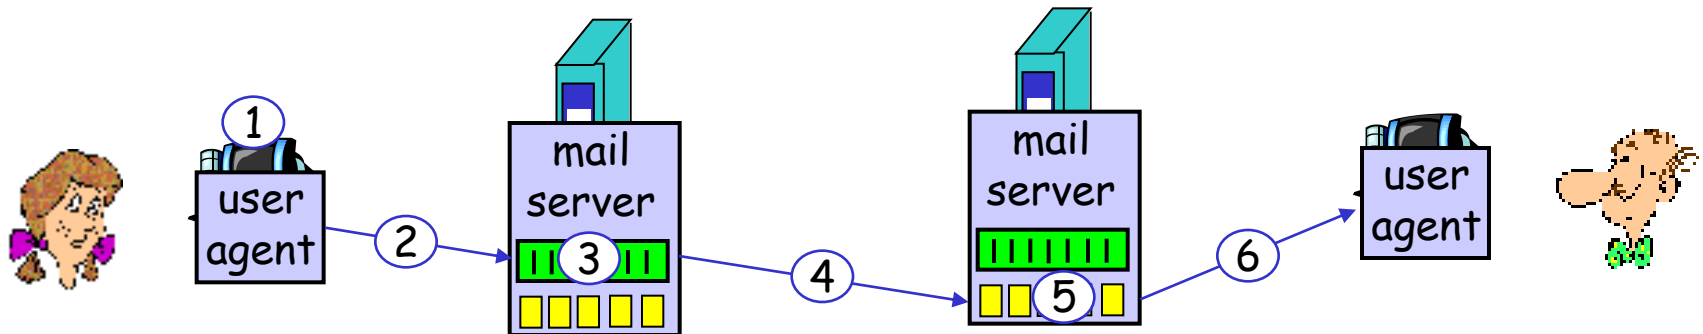

## Mail Servers

- ❑ **mailbox** contains incoming messages for user
- ❑ **message queue** of outgoing (to be sent) mail messages
- ❑ **SMTP protocol** between mail servers to send email messages
  - ❖ client: sending mail server
  - ❖ "server": receiving mail server

# Scenario: Alice sends message to Bob

- 1) Alice uses UA to compose message and "to"  
`bob@someschool.edu`
- 2) Alice's UA sends message to her mail server; message placed in message queue
- 3) Client side of SMTP opens TCP connection with Bob's mail server
- 4) SMTP client sends Alice's message over the TCP connection
- 5) Bob's mail server places the message in Bob's mailbox
- 6) Bob invokes his user agent to read message

# Mail Message Contents

## □ Each queued message has:

### ❖ Message text

- RFC 822 header with message envelope and list of recipients
- Message body, composed by user

### ❖ A list of mail destinations

- Extracted by user agent/ SMTP server from header for faster access
- May require expansion of mailing lists (alias)

# SMTP Sender

- ❑ Takes message from queue
- ❑ Transmits to proper destination host
  - ❖ Via SMTP transaction
  - ❖ Over one or more TCP connections to port 25
- ❑ When all destinations are processed (an electronic mail can have more than one destinations), message is deleted

# Optimization by Sender

- ❑ If same message is sent to multiple users on a given host, it is sent only once
  - ❖ Delivery to users handled at destination host
- ❑ If multiple messages are ready for given host, a single TCP connection can be used
  - ❖ Saves overhead of setting up and dropping connection

# Possible Errors

- ❑ Host unreachable
- ❑ Host out of operation
- ❑ TCP connection fail during transfer
- ❑ Faulty destination address
  - ❖ User error
  - ❖ Target user address has changed
  - ❖ Redirect if possible
  - ❖ Inform user if not
- ❑ Sender can re-queue mail
  - ❖ Give up after a period

# SMTP Protocol - Reliability

- ❑ Used to transfer messages from sender to receiver over TCP connection
  - ❖ Uses port number 25
- ❑ Attempts to provide reliable service
- ❑ No guarantee to recover lost messages
- ❑ TCP ensures messages arrive at the nearest SMTP server
- ❑ No end-to-end ACK to sender
- ❑ Error indication report not guaranteed

# SMTP Receiver

- ❑ Accepts arriving message
- ❑ Places in user mailbox or copies to outgoing queue for forwarding
- ❑ Receiver must
  - ❖ Verify local mail destinations
  - ❖ Deal with errors
    - Transmission
    - Lack of disk space

# SMTP Forwarding

- ❑ Mostly direct transfer from sender host to receiver host
- ❑ May go through intermediate mail servers via forwarding capability
  - ❖ Sender can specify route

# SMTP System Overview

- ❑ Commands and responses exchanged between sender and receiver
- ❑ Initiative with sender
  - ❖ Establishes TCP connection over port 25
- ❑ Sender sends commands to receiver
  - ❖ E.g. HELO <domain><CRLF>
- ❑ Each command generates exactly one reply
  - ❖ E.g. 250 requested mail action ok; completed

# SMTP Replies

- ❑ Starts with 3-digit code
- ❑ Leading digit indicates category
  - ❖ 2xx: Positive completion reply
  - ❖ 3xx: Positive intermediate reply
  - ❖ 4xx: Transient negative completion reply
  - ❖ 5xx: Permanent negative completion reply

# Operation Phases

- ❑ Connection setup
- ❑ Exchange of command-response pairs
- ❑ Connection terminated

# Connection Setup - 1

- ❑ Sender opens TCP connection with receiver
- ❑ Once connected, receiver identifies itself
  - ❖ 220 <domain> service ready
- ❑ Sender identifies itself
  - ❖ HELO
- ❑ Receiver accepts sender's identification
  - ❖ 250 OK
- ❑ If mail service not available, the second step above becomes:
  - ❖ 421 service not available

# Connection Setup - 2

- ❑ The MAIL FROM command identifies originator
  - ❖ Gives reverse path to be used for error reporting
  - ❖ Receiver returns 250 OK or appropriate failure/ error message
- ❑ One or more RCPT TO commands identify recipients for the message
- ❑ DATA command transfers message text (indicated by . on a single line)

# Closing Connection

- ❑ Two steps:
  - ❖ Sender sends QUIT and waits for reply
  - ❖ Then initiate TCP close operation
- ❑ Receiver initiates TCP close after sending reply to QUIT

# SMTP: final words

- ❑ SMTP uses persistent connections
- ❑ SMTP requires message (header & body) to be in 7-bit ASCII
- ❑ SMTP server uses CRLF.CRLF to determine end of message

## Comparison with HTTP:

- ❑ HTTP: pull
- ❑ SMTP: push
- ❑ both have ASCII command/response interaction, status codes
- ❑ HTTP: each object encapsulated in its own response msg
- ❑ SMTP: multiple objects sent in multipart msg
